SYLVIA ADIMIKE GOALS.

A year from now, the goal is to be a full stack software engineer. My career goals are in the tech industry. To be specific, I want to work, learn, teach in the short run and at the long run, have my own firm in the tech industry. My firm will be geared towards raising talents who can proffer real time solutions to problems and training world class leaders. Also, to train and counsel those who are just interested in having the knowledge of coding.

I can achieve this by finishing my classes at CodeLab and interning there to gain more experience. Practicing vigorously everyday to gain mastery of the technical skills. Nurturing good character and having the right attitude to work, life and everything and everyone. I will measure these results by going for hackathons, bootcamps, pitches, checking out my competitors progress and see how far I am growing and if not, level up, adopt best practices and be the best.

The goal of learning, training, working and having a firm in the tech industry is very much attainable and reasonable. I have to check out my SWOT(Strength, Weakness, Opportunity, Threat) Analysis, have the right attitude and competence which I will gain from my years of practices and research and money which I will positively win from pitches and possibly fund-raising.

At the long run, I hope to really have a community of techies. Having People of the same like minds keying into

my firm and for my firm to be recognized both locally and globally.

First, to be a full stack software engineer, I promise myself from August 1st 2022 – August 1st 2023 to be really good with it. That's for the primary goal. While for the stretch goal, in 5 years time from now I hope to achieve all this.
